## Shut-off valves

Types SVA-S and SVA-L, 52 bar (754 psi)

SVA shut-off valves are available in angleway and straightway versions and with Standard neck (SVA-S) and Long neck (SVA-L)

The shut-off valves are designed to meet all industrial refrigeration application requirements and are designed to give favourable flow characteristics and are easy to dismantle and repair when necessary.

The valve cone is designed to ensure perfect closing and withstand a high system pulsation and vibration, which can be present specifically in the discharge line.

### Features

- Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and all flammable refrigerants.
- Modular Concept:
  - Each valve housing is available with several different connection types and sizes.
  - Possible to convert SVA-S or SVA-L to any other product in the Flexline™ SVL family (hand operated regulating valve, check & stop valve, check valve or strainer) just by replacing the complete top part.
- Fast and easy valve overhaul service. It is easy to replace the top part and no welding is needed
- Optional accessories:
  - Heavy duty industrial hand wheel for frequent operation.
  - Cap for infrequent operation.
- Available in angleway and straightway versions with Standard neck or Long neck (DN 15 to DN 40) for insulated systems
- Each valve type is clearly marked with type, size and performance range
- The valves and caps are prepared for sealing, to prevent operation by unauthorized persons, using a seal wire
- Internal metal backseating:
  - DN 6 - 65 (¼ - 2 ½ in)
- Internal PTFE backseating:
  - DN 80 - 200 (3 - 8 in)
- Can accept flow in both directions.
- Housing and bonnet material is low temperature steel according to requirements of the Pressure Equipment Directive and other international classification authorities.
- Equipped with stainless steel bolts.
- Max. working pressure: 52 bar g / 754 psi g
- Temperature range: -60 - 150 °C / -76 - 302 °F
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company

## Shut-off valves, types SVA-S and SVA-L, 52 bar (754 psi)

### Design

#### Connections

Available with the following connections:

- Butt-weld DIN (EN 10220)
- Butt-weld ANSI (B 36.10 Schedule 80), DN 6 - 40 (¼ - 1 ½ in)
- Butt-weld ANSI (B 36.10 Schedule 40), DN 50 - 200 (2 - 8 in)
- Butt-weld GOST, (8734-75 and 8732-78) DN 10 - 150 (¾ - 6 in)
- Socket Weld (ANSI B 16.11), DN 15 - DN 50 (½ - 2 in)
- Outside pipe thread G ½ in - G ¾ in (ISO 228/1)
- FPT Female Pipe Thread, NPT (ANSI/ASME B 1.20.1), DN 15 - 32 (½ - 1 ¼ in)

#### Housing

Made of special, cold resistant steel.

#### Valve cone

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat when the valve is opened and closed and the special design will avoid cone spin due to pulsation and vibration when the valve is in open position. A teflon tightening ring provides perfect sealing with minimum closing force.

#### Spindle

Made of polished stainless steel, ideal for leap seal sealing.

#### Packing gland

The low temperature packing gland ensures a perfect tightness in the range: -60/+150 °C (-76/+302 °F). The packing glands are equipped with a scraper ring to prevent penetration of dirt and ice into the packing gland.

#### Pressure Equipment Directive (PED)

SVA valves are approved according to the European standard specified in the Pressure Equipment Directive and are CE marked.

For further details / restrictions - see Installation Instruction.

#### Installation

It is recommended that the valves be installed in the direction of flow indicated by the arrow on the valve body. The valve can be installed in the opposite direction but this slightly reduces the  $k_v$ -value ( $C_v$ -value).

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to installation instructions for SVA.

Example of Marking Ring

SVA			
<b>Nominal bore</b>	DN ≤ 25 mm (1 in)	DN 32 - 80 mm (1 ¼ - 3 in)	DN 100 - 200 mm (4 - 8 in)
<b>Classified for</b>	Fluid group I		
<b>Category</b>	Article 3, paragraph 3	II	III

## Shut-off valves, types SVA-S and SVA-L, 52 bar (754 psi)

### Technical data

- Refrigerants  
Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and all flammable refrigerants.
- Temperature range  
-60 – 150 °C / -76 – 302 °F.
- Max. working pressure  
52 bar g / 754 psi g.

## Shut-off valves

Types SVA-S and SVA-L, 65 bar (943 psi)

SVA shut-off valves are available in angleway and straightway versions and with Standard neck (SVA-S) and Long neck (SVA-L)

The shut-off valves are designed to meet all industrial refrigeration and ammonia heat pump application requirements and are designed to give favourable flow characteristics and are easy to dismantle and repair when necessary.

The valve cone is designed to ensure perfect closing and withstand a high system pulsation and vibration, which can be present specifically in the discharge line.

### Features

- Modular Concept:
  - Each valve housing is available with DIN and ANSI butt weld connection and in several different sizes.
  - Possible to convert SVA-S or SVA-L to any other product in the Flexline™ SVL family (regulating valve, check & stop valve, check valve or strainer) just by replacing the complete top part.
- Fast and easy valve overhaul service. It is easy to replace the top part and no welding is needed.
- Optional accessories:
  - Heavy duty industrial hand wheel for frequent operation.
  - Cap for infrequent operation.
- Available in angleway and straightway versions with Standard neck or Long neck (DN 15 to DN 40) for insulated systems.
- Each valve type is clearly marked with type, size and performance range.
- The valves and caps are prepared for sealing, to prevent operation by unauthorized persons, using a seal wire.
- Internal metal backseating:
  - DN 6 - 65 (¼ - 2½ in.)
 Internal PTFE backseating:
  - DN 80 - 200 (3 - 8 in.)
- Can accept flow in both directions.
- Housing and bonnet material is low temperature steel according to requirements of the Pressure Equipment Directive and other international classification authorities.
- Equipped with 42CrMo5 bolts to withstand high pressure.
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company.

## Shut-off valves, types SVA-S and SVA-L, 65 bar (943 psi)

### Technical data

- **Refrigerants**  
Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and flammable refrigerants.  
For further information please see installation guide for SVA.
- **Temperature range**  
-60/+150°C (-76/+302°F).
- **Max. working pressure**  
65 bar (943 psi)

### Design

#### Housing

Made of special, cold resistant steel.

#### Valve cone

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat when the valve is opened and closed and the special design will avoid cone spin due to pulsation and vibration when the valve is in open position. A teflon tightening ring provides perfect sealing with minimum closing force.

#### Spindle

Made of polished stainless steel, ideal for leap seal sealing.

#### Packing gland

The low temperature packing gland ensures a perfect tightness in the range: -60/+150°C (-76/+302°F). The packing glands are equipped with a scraper ring to prevent penetration of dirt and ice into the packing gland.

#### Installation

It is recommended that the valves be installed in the direction of flow indicated by the arrow on the valve body. The valve can be installed in the opposite direction but this slightly reduces the  $K_v$ -value ( $C_v$ -value).

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to installation instructions for SVA.

Example of Marking Ring

#### Pressure Equipment Directive (PED)

SVL valves are approved according to the European standard specified in the Pressure Equipment Directive and are CE marked.

For further details / restrictions - see Installation guide.

# Shut-off valves in stainless steel

## Type SVA-S SS and SVA-L SS

In certain specific areas such as outdoor applications and corrosive atmospheres, such as coastal installations, there is a need for high surface protection to prevent failure due to corrosion.

Today's food safety standards often call for daily treatment with detergents to protect against bacteria growth, again producing a need for high surface protection.

SVA-S SS are angleway and straightway stainless steel shut-off valves, which are designed to meet all industrial refrigeration application requirements.

The valves are designed to give favourable flow characteristics and are easy to dismantle and repair when necessary. The valve cone is designed to ensure perfect closing.

### Features

- Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and all flammable refrigerants.
- Optional accessories:
  - Heavy duty industrial hand wheel for frequent operation.
  - Cap for infrequent operation.
- Available in angleway and straightway versions with Standard neck or Long neck (DN 15 to DN 40) for insulated systems.
- Designed to give favourable flow conditions.
- Internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure.
- Housing is made of stainless steel approved for low temperature operations.
- Easy to disassemble for inspection and service.
- SVA-S/L SS shut-off valves can accept flow in either direction.

- Butt-weld DIN and ANSI connections.
- Maximum allowable working pressure and temperature range:

DN 15-65	52 bar (754 psi) at -60°C/+50°C (-76°F/+122°F)
DN 80-125	50 bar (725 psi) at -60°C/+50°C (-76°F/+122°F)

For SVA-S/L SS see the relation between PS and temperature in the curve on page 2.

- Temperature range: -60/+150°C (-76 +302°F).
- Compact and light valves for easy handling and installation.
- Classification: DNV, CRN, BV, EAC etc. To get an updated list of certification on the products please contact your local Danfoss Sales Company.

## Shut-off valves in stainless steel, type SVA-S SS and SVA-L SS

### Pressure and temperature range

### Design

#### Connections

Available with the following connections:

- Butt-weld DIN (EN 10220)  
DN 15 - 125 (½ - 5 in.)
- Butt-weld ANSI (B 36.19M)  
DN 15 - 100 (½ - 4 in.)

#### Housing

Made of stainless steel approved for low temperature operations.

#### Valve cone

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat, when the valve is opened and closed. A teflon tightening ring provides perfect sealing at a minimum closing momentum.

#### Spindle

Made of polished stainless steel, ideal for O-ring sealing. Furthermore, parts of the spindle are heat treated to obtain anti-abrasive/adhesive properties.

#### Packing gland

The stainless steel packing gland comprises a spring loaded seal packing gland which ensures a perfect tightness in the range: -60/+150°C (-76/+302°F). The packing glands are equipped with a scraper ring to prevent penetration of dirt and ice into the packing gland.

#### Pressure Equipment Directive (PED)

The stainless steel valves are approved and CE marked in accordance with the Pressure Equipment Directive - 97/23/EC.

#### Installation

It is recommended that the valves be installed in the direction of flow indicated by the arrow on the valve body. The valve can be installed in the opposite direction but this slightly reduces the  $k_v$ -value ( $C_v$ -value).

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to installation instructions for SVA-S/L SS.

SVA-S/L SS			
<b>Nominal bore</b>	DN ≤ 25 mm (1 in.)	DN 32-80 mm (1¼ - 3 in.)	DN 100 - 125 mm (4-5 in.)

### Technical data

- **Refrigerants**  
Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and all flammable refrigerants. For further information please contact your local Danfoss Sales Company.
- **Temperature Range**  
-60/+150°C (-76/+302°F).
- **Pressure range**  
The valves are designed for max. working pressure 52 bar g (754 psi g).

## Shut-off valves

Types SVA-DL and SVA-DH 250-300

SVA-DL and SVA-DH are angleway shut-off valves designed to meet all industrial refrigeration application requirements.

**SVA-DL (Delta pressure Low)** is designed with a restriction in the opening function. High differential pressure can be applied from the side port and reduced pressure can be applied from bottom port. SVA-DL is a two-step valve for pressure relief.

**SVA-DH (Delta pressure High)** is designed without restriction in the opening function. As a result of its balanced design this valve is able to open at all differential pressures with limited torque.

The angleway shut-off valves are carefully designed to give favourable flow conditions. Easy to dismantle for inspection and repair.

Both SVA-DL & DH shut-off valves have internal backseating enabling the spindle seal to be replaced with the valve still under pressure.

The valves are designed to give favourable flow characteristics and are easy to dismantle for servicing. The valve cone is designed to ensure perfect closing.

### Features

- Applicable to HC, HCFC, HFC, R717 (Ammonia) and R744 (CO<sub>2</sub>)
- Optional accessories:
  - Heavy duty industrial handwheel for frequent operation
  - Vented cap for infrequent operation
- Available in angleway version with extended bonnet for insulated systems
- The valve caps can be wire-sealed, to prevent operation by unauthorised persons
- Internal PTFE backseating
- The bonnet is suitable for installation in insulated low temperature applications
- The housing and bonnet are made from low temperature steel in accordance with the requirements of the Pressure Equipment Directive and other international classification authorities
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company

## Shut-off valves, types SVA-DL and SVA-DH 250-300

### Design

#### Connections

Available with the following connections:  
 Butt-weld DIN 2448  
 Butt-weld ANSI B 36.10  
 - DN250: Schedule 40  
 - DN300: STD

#### Housing and bonnet

Made from special, cold-resistant steel approved for low temperature operations.

#### Bolts

Stainless steel, Quality A2-70

#### Valve cone assembly

The valve cone assembly can be turned on the spindle, thus there is no friction between cone and seat when the valve is opened and closed. A Teflon tightening ring provides perfect sealing at a minimum closing torque.

#### Spindle

Made of polished stainless steel, ideal for O-ring sealing.

#### Packing gland

The packing gland comprises a spring loaded seal packing which ensures perfect tightness in the range: -60 – 150 °C / -76 – 302 °F. Furthermore, the packing glands incorporate a scraper ring to prevent the penetration of dirt and ice.

### Marking

Each valve type is clearly marked with type, size and performance range.

Example of marking ring, SVA-DH

#### Pressure Equipment Directive (PED)

SVA-DL and DH valves are approved and CE marked in accordance with the Pressure Equipment Directive - 97/23/EC.

For further details / restrictions - see Installation Instruction.

SVA-DL & DH valves		
Nominal bore	DN 250 mm (10 in)	DN 300 mm (12 in)
Classified for	Fluid group I	
Category	III	IV

## Shut-off valves, types SVA-DL and SVA-DH 250-300

### Technical data

#### Refrigerants

Applicable to HC, HCFC, HFC, R717 (Ammonia) and R744 (CO<sub>2</sub>)

For further information please see installation instruction for SVA-DL and SVA-DH.

#### Temperature range

SVA-DL and SVA-DH

-60 – 150 °C / -76 – 302 °F

#### Pressure range

SVA-DL and SVA-DH

40 bar g / 580 psi g at -60 – 60 °C / -76 °F – 140 °F

36 bar g / 522 psi g at 60 – 80 °C / 140 – 176 °F

32 bar g / 464 psi g at 80 – 120 °C / 176 – 248 °F

28 bar g / 406 psi g at 120 – 150 °C / 248 – 302 °F

## Shut-off valves, types SVA-DL and SVA-DH 250-300

### Function

#### SVA-DL

The SVA-DL shut-off valve is designed with a restriction in the flow direction (differential pressure). To ensure the most favourable valve performance the flow must be directed from the side port towards the valve cone. Operation of the valve with flow in this direction is made possible by the two-step opening valve cone as illustrated below.

The sketches below give the maximum pressures at which the valve can be operated manually and tightness can be achieved.

#### SVA-DH

The SVA-DH shut-off valve is designed without restrictions in either flow direction or differential pressure. Due to the balanced valve cone design the torque required to operate the valve is minimized and the valve can be opened and closed against high pressure with flow in any direction.

### Ordering

The table below can be used to identify the valve required.

Please note that the type codes only serve to identify the valves, some of which may not form part of the standard product range.

For further information please contact your local Danfoss Sales Company.

#### Type codes

Valve type Nominal size in mm	SVA-DL SVA-DH	Shut-off valve Shut-off valve	( $\Delta p$ Low) ( $\Delta p$ High)	Available connections	
				D	A
(Valve size measured on the connection diameter)	250	DN250	X	X	X
	300	DN300	X	X	X
Connections	D	Butt weld connection: DIN 2448			
	A	Butt weld connections: ANSI B 36.10 DN250: Schedule 40 DN300: STD			
Other equipment	CAP H-WHEEL	Aluminum cap Steel handweel			

#### Important!

Where products need to be certified according to specific certification societies or where higher pressures are required, the relevant information should be included at the time of ordering.

## Hand operated regulating valves

### Types REG-SA and REG-SB, 52 bar (754 psi)

REG-SA and REG-SB are angleway and straightway hand operated regulating valves, which act as normal shut-off valves in closed position.

The valves are available in two different versions – REG-SA and REG-SB designed for regulation purposes in liquid and expansion lines.

The valves are designed to meet the strict quality requirements on refrigerating installations specified by the international classification societies and are carefully designed to present favourable flow conditions and accurate linear characteristics.

REG-SA and REG-SB are equipped with vented cap and internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure.

#### Features

- Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>), Propane, Butane, Iso-Butane and Ethane.  
R717 Heat Pump and Propylene applications with replaced O-ring.
- Modular Concept:
  - Each valve housing is available with several different connection types and sizes.
  - Possible to convert REG-SA or REG-SB to any other product in the Flexline™ SVL family (shut-off valve, check & stop valve, check valve or strainer) just by replacing the complete top part.
- Fast and easy valve overhaul service. It is easy to replace the top part and no welding is needed.
- Designed to ensure perfect regulation
- Internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure.
- Easy to disassemble for inspection and possible repair.
- Long neck versions (DN 15 to DN 40) for insulated systems available from parts programme.
- Max. operating pressure: 52 bar g (754 psi g)
- Temperature range: –60/+150°C (–76/+302°F)
- Acts as a normal shut-off valve in closed position.
- Housing and bonnet material is low temperature steel according to requirements of the Pressure Equipment Directive and other international classification authorities.
- Exact capacity and setting of the valve can be calculated for all refrigerants by means of Coolselector®2 (Danfoss calculation and selection software).
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company.

## Hand operated regulating valves, types REG-SA and REG-SB

### Design

#### Housing

Housing is Standard SVA angleway or straightway housing allowing other inserts from the SVL platform to be installed. Material is special, cold resistant steel

#### Connections

Available with the following connections:

- Butt-weld DIN (EN 10220)
  - DN 10 - 65 ( $\frac{3}{8}$  - 2  $\frac{1}{2}$  in)
- Butt-weld ANSI (B 36.10 Schedule 80)
  - DN 10 - 40 ( $\frac{3}{8}$  - 1  $\frac{1}{2}$  in)
- Butt-weld ANSI (B 36.10 Schedule 40)
  - DN 50 - 65 (2 - 2  $\frac{1}{2}$  in)
- Butt-weld GOST, (8734-75 and 8732-78)
  - DN 10 - 65 ( $\frac{3}{8}$  - 2  $\frac{1}{2}$  in)
- Socket weld (ANSI B 16.11)
  - DN 15 - 40 ( $\frac{1}{2}$  - 1  $\frac{1}{2}$  in)
- FPT inside pipe thread, NPT (ANSI/ASME B 1.20.1)
  - DN 15 - 32 ( $\frac{1}{2}$  - 1  $\frac{1}{4}$  in)

#### The cone

The valves are available in two different versions – REG-SA with an A cone and REG-SB with a B cone. The A cone is designed for expansion lines, while the B cone is designed for regulating purposes e.g. liquid lines.

The valve cone is designed to ensure perfect regulation and provide an extensive regulating area. Irrespective of the refrigerant used, it is easy to obtain the correct capacity. A cone seal ring provides perfect sealing at a minimum closing momentum.

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat when the valve is opened and closed.

The spindle is made of polished stainless steel, which is ideal for O-ring sealing.

#### Packing gland - REG-SA and REG-SB

The “full temperature range” packing gland ensures perfect tightness in the whole range: -60 – 150 °C / -76 – 302 °F. The packing glands are equipped with a scraper ring to prevent penetration of dirt and ice.

#### Installation

Install the valve with the spindle up or in horizontal position. The flow must be directed towards the cone.

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to product instruction for REG-SA and REG-SB.

Example of marking ring, REG-SA

#### Pressure Equipment Directive (PED)

REG valves are approved according to the European standard specified in the Pressure Equipment Directive and are CE marked.

REG-SA and REG-SB valves			
Nominal bore	DN = < 25 mm (1 in)	DN32-80 mm (1 $\frac{1}{4}$ - 3 in)	DN100 - 125 mm (4 - 5 in)

### Technical data

- **Refrigerants**  
Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>), Propane, Butane, Iso-Butane and Ethane.  
R717 Heat Pump and Propylene applications with replaced O-ring.
- **Temperature range**  
–60/+150°C (–76/+302°F)
- **Max working pressure**  
52 bar g (754 psi g)
- **Flow coefficients**  
Flow coefficients for fully opened valves from  $k_v = 0.15$  to 80 m<sup>3</sup>/h ( $C_v = 0.17$  to 92.5 USgal/min).

## Hand operated regulating valves, types REG-SA and REG-SB

### Computation and selection

#### Introduction

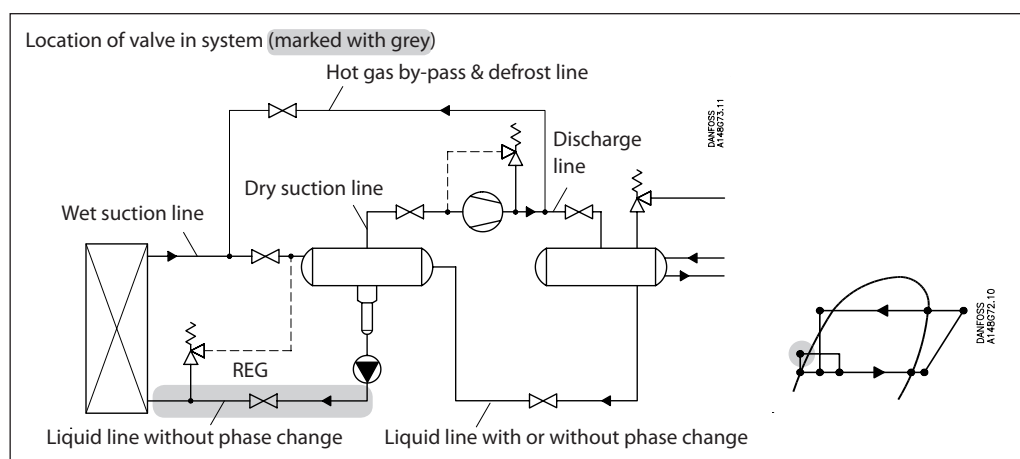

In refrigeration plants, hand operated regulating valves are primarily used in liquid lines in order to regulate the flow of refrigerant. The valves can, however, also be used as expansion valves. From a calculation point of view the two fields of application are very different.

Normal flow is the term used to describe the general case where the flow through the valve is proportional to the square root of the pressure drop across it and inversely proportional to the density of the refrigerant (Bernoullis equation).

This relationship between mass flow, pressure drop and density satisfies the majority of all valve applications with refrigerants and brines.

Normal flow is characterised by turbulent flow through the valve without any phase change. The following capacity curves are based on the above mentioned assumption.

Application of the hand operated regulating valves outside the normal flow area will reduce the capacity of the valve considerably. In such cases it is recommended to use Coolselector<sup>®</sup>2 (Danfoss calculation and selection software).

#### Sizing hand operated regulating valve for liquid flow

Liquid refrigerants: Use the liquid tables, fig. 6 - 10. For other refrigerants and brines, "Normal flow" (Turbulent flow); see below and use the flow coefficient tables (fig. 1 - 5).

#### SI-units

Mass flow:

$$k_v = \frac{G}{\sqrt{\rho \times 1000 \times \Delta p}} = G \times C_A \text{ [m}^3/\text{h]}$$

Volume flow:

$$k_v = \frac{\dot{V}}{\sqrt{\frac{1000 \times \Delta p}{\rho}}} \text{ [m}^3/\text{h]}$$

#### Imperial units

Mass flow:

$$C_v = \frac{0.95 \times G}{\sqrt{\rho \times \Delta p}} = 31.6 \times G \times C_A \text{ [USgal/min.]}$$

Volume flow:

$$C_v = \frac{0.127 \times \dot{V}}{\sqrt{\frac{\Delta p}{\rho}}} \text{ [USgal/min.]}$$

$k_v$	[m <sup>3</sup> /h]	Quantity [m <sup>3</sup> /h] of water flowing through a valve at a pressure loss of 1 bar (according to VDE/VDI Norm 2173).	$C_v$	[US gal/min]	Quantity [US gal/min] of water flowing through a valve at a pressure loss of 1 psi.
$P_1$	[bar]	Pressure before the valve (upstream).	$P_1$	[psi]	Pressure before the valve (upstream).
$P_2$	[bar]	Pressure after the valve (downstream).	$P_2$	[psi]	Pressure after the valve (downstream).
$\Delta p$	[bar]	Actual pressure loss across the valve ( $P_1 - P_2$ ).	$\Delta p$	[psi]	Actual pressure loss across the valve ( $P_1 - P_2$ ).
$G$	[kg/h]	Mass flow through the valve.	$G$	[lb/min]	Mass flow through the valve.
$\dot{V}$	[m <sup>3</sup> /h]	Volume flow through the valve.	$\dot{V}$	[US gal/min]	Volume flow through the valve.
$\rho$	[kg/m <sup>3</sup> ]	Density of the refrigerant before the valve.	$\rho$	[lb/ft <sup>3</sup> ]	Density of the refrigerant before the valve.
$C_A$		Calculation factor (fig. 11).	$C_A$		Calculation factor (fig. 11).

## Hand operated regulating valves, types REG-SA and REG-SB

### Computation and selection

Example 1.

Refrigerant: R 717  
 Refrigerant flow: 2200 kg/h  
 Pressure drop:  $\Delta p = 0.5$  bar

The above mentioned example is illustrated on the following flow rate diagram and shows that REG-SB 15 and 20 with cone B can be used. The main rule is that nominal regulation range should be below 85% opening degree. If the arrowline is crossing 2 cone curves, the smaller cone should be selected if opening degree < 85%.

The example is only correct if the density of the refrigerant is approx.  $670 \text{ (kg/m}^3\text{)}$ , and there must be no build-up of flash gas in the valve.

Flow rate diagram

Fig. 12

## Hand operated regulating valves, types REG-SA and REG-SB

### Computation and selection

Example 2.

Brine, density  $\rho$ : 1150 [kg/m<sup>3</sup>]  
 Brine flow  $G$ : 2,700 [kg/h]  
 Pressure drop  $\Delta p$ : 0.5 [bar]

In this example it is not possible to use the selection diagrams (fig. 6 - 10) as the refrigerant in question is not included.

Use the curves of the  $k_v$ -values instead (fig. 1 - 5) and calculate the required  $k_v$  by means of the formulas in the "Introduction" passage at the beginning of this chapter. Alternatively calculate the  $k_v$ -values by means of the calculation factor  $C_A$  (fig. 13) and the flow rate diagram (in this example: fig. 14) as per the following calculation example.

Calculation example:

Required  $k_v$ -value  
 $C_A = 0.00132$  (from fig. 18)  
 $k_v = C_A \times G$   
 $k_v = 0.00132 \times 2,700$  [kg/h]  
 $= 3.56$  [m<sup>3</sup>/h]

## Hand regulating valves

Types REG-SA and REG-SB, 65 bar (943 psi)

REG-SA and REG-SB are angleway and straightway hand regulating valves, which act as normal stop valves in closed position.

The valves are available in two different versions – REG-SA and REG-SB designed for regulation purposes in liquid and expansion lines.

The valves are designed to meet the strict quality requirements on refrigerating/heat pump installations specified by the international classification societies and are carefully designed to present favourable flow conditions and accurate linear characteristics.

REG-SA and REG-SB are equipped with vented cap and internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure.

### Features

- Modular Concept:
  - Each valve housing is available with DIN and ANSI butt weld connection and in several different sizes.
  - Possible to convert REG-SA or REG-SB to any other product in the Flexline™ SVL family (shut-off valve, check & stop valve, check valve or strainer) just by replacing the complete top part.
- Fast and easy valve overhaul service. It is easy to replace the top part and no welding is needed.
- Designed to ensure perfect regulation
- Internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure.
- Easy to disassemble for inspection and possible repair.
- Acts as a normal stop valve in closed position.
- Housing and bonnet material is low temperature steel according to requirements of the Pressure Equipment Directive and other international classification authorities.
- Exact capacity and setting of the valve can be calculated for all refrigerants by means of Coolselector™.
- Classification: DNV, CRN, BV, EAC etc. To get an updated list of certification on the products please contact your local Danfoss Sales Company.
- Equipped with 42CrMo5 bolts to withstand high pressure.
- Service kits with replacement O-rings for R717 Heat Pump and R1270 Propylene include separate ID-ring for ID of application

## Hand regulating valves, types REG-SA and REG-SB, 65 bar (943 psi)

### Technical data

- **Refrigerants**  
Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>) and flammable refrigerants. For further information refer to the product instruction for REG-SA and REG-SB.
- **Temperature range**  
-60/+150°C (-76/+302°F).
- **Max. working pressure**  
65 bar (943 psig).  
*With O-ring replaced for valves up to DN40 (Service kit):*  
Heat pump configuration: R717 - 65 bar (943 psi) @ +100°C to +150°C (+212°F to +302°F) continuous.  
Propylene configuration: R1270 - 65 bar (943 psi) @ -60°C to 150°C (-76°F to 302°F).

### Design

#### Housing

Housing is Standard SVA angleway or straightway housing allowing other inserts from the SVL platform to be installed. Material is special, cold resistant steel

#### The cone

The valves are available in two different versions – REG-SA with an A cone and REG-SB with a B cone. The A cone is designed for expansion lines, while the B cone is designed for regulating purposes e.g. liquid lines.

The valve cone is designed to ensure perfect regulation and provide an extensive regulating area. Irrespective of the refrigerant used, it is easy to obtain the correct capacity. A cone seal ring provides perfect sealing at a minimum closing momentum.

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat when the valve is opened and closed.

#### Spindle

The spindle is made of polished stainless steel, which is ideal for O-ring sealing.

#### Packing gland - REG-SA and REG-SB

The "full temperature range" packing gland ensures perfect tightness in the whole range: -60/+150°C (-76/+302°F). The packing glands

are equipped with a scraper ring to prevent penetration of dirt and ice.

#### Installation

Install the valve with the spindle up or in horizontal position. The flow must be directed towards the cone.

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to product instruction for REG-SA and REG-SB.

Example of marking ring, REG-SA

#### ID ring for special application

After converting a REG-SA/SB (DN 10-40) valve for Heat Pump/Propylene applications (replacing O-ring) the color marked ID tag included in the service kit must be fixed to the valve as shown in figure to the right.

The ID tag indicates the special application and identifies the installed O-ring.

#### Pressure Equipment Directive (PED)

SVL valves are approved according to the European standard specified in the Pressure Equipment Directive and are CE marked.

For further details / restrictions - see Installation guide.

## Hand regulating valves, types REG-SA and REG-SB, 65 bar (943 psi)

### Computation and selection

#### Introduction

In refrigeration plants, regulating valves are primarily used in liquid lines in order to regulate the flow of refrigerant. The valves can, however, also be used as expansion valves. From a calculation point of view the two fields of application are very different.

Normal flow is the term used to describe the general case where the flow through the valve is proportional to the square root of the pressure drop across it and inversely proportional to the density of the refrigerant (Bernoullis equation).

This relationship between mass flow, pressure drop and density satisfies the majority of all valve applications with refrigerants and brines.

Normal flow is characterised by turbulent flow through the valve without any phase change. The following capacity curves are based on the above mentioned assumption.

Application of the regulating valves outside the normal flow area will reduce the capacity of the valve considerably. In such cases it is recommended to use Coolselector®2.

#### Sizing regulating valve for liquid flow

Liquid refrigerants: Use the liquid tables, fig. 6 - 10. For other refrigerants and brines, "Normal flow" (Turbulent flow); see below and use the flow coefficient tables (fig. 1 - 5).

#### SI-units

Mass flow:

$$k_v = \frac{G}{\sqrt{\rho \times 1000 \times \Delta p}} = G \times C_A \text{ [m}^3/\text{h]}$$

Volume flow:

$$k_v = \frac{\dot{V}}{\sqrt{\frac{1000 \times \Delta p}{\rho}}} \text{ [m}^3/\text{h]}$$

#### Imperial units

Mass flow:

$$C_v = \frac{0.95 \times G}{\sqrt{\rho \times \Delta p}} = 31.6 \times G \times C_A \text{ [USgal/min.]}$$

Volume flow:

$$C_v = \frac{0.127 \times \dot{V}}{\sqrt{\frac{\Delta p}{\rho}}} \text{ [USgal/min.]}$$

$k_v$	[m <sup>3</sup> /h]	Quantity [m <sup>3</sup> /h] of water flowing through a valve at a pressure loss of 1 bar (according to VDE/VDI Norm 2173).
$P_1$	[bar]	Pressure before the valve (upstream).
$P_2$	[bar]	Pressure after the valve (downstream).
$\Delta p$	[bar]	Actual pressure loss across the valve ( $P_1 - P_2$ ).
$G$	[kg/h]	Mass flow through the valve.
$\dot{V}$	[m <sup>3</sup> /h]	Volume flow through the valve.
$\rho$	[kg/m <sup>3</sup> ]	Density of the refrigerant before the valve.
$C_A$		Calculation factor (fig. 11).

$C_v$	[US gal/min]	Quantity [US gal/min] of water flowing through a valve at a pressure loss of 1 psi.
$P_1$	[psi]	Pressure before the valve (upstream).
$P_2$	[psi]	Pressure after the valve (downstream).
$\Delta p$	[psi]	Actual pressure loss across the valve ( $P_1 - P_2$ ).
$G$	[lb/min]	Mass flow through the valve.
$\dot{V}$	[US gal/min]	Volume flow through the valve.
$\rho$	[lb/ft <sup>3</sup> ]	Density of the refrigerant before the valve.
$C_A$		Calculation factor (fig. 11).

## Hand regulating valves, types REG-SA and REG-SB, 65 bar (943 psi)

### Computation and selection

Example 1.

Refrigerant: R 717  
 Refrigerant flow: 2200 kg/h  
 Pressure drop:  $\Delta p = 0.5$  bar

The above mentioned example is illustrated on the following flow rate diagram and shows that REG-SB 15 and 20 with cone B can be used. The main rule is that nominal regulation range should be below 85% opening degree. If the arrowline is crossing 2 cone curves, the smaller cone should be selected if opening degree  $< 85\%$ .

The example is only correct if the density of the refrigerant is approx.  $670 \text{ (kg/m}^3\text{)}$ , and there must be no build-up of flash gas in the valve.

Flow rate diagram

## Hand regulating valves, types REG-SA and REG-SB, 65 bar (943 psi)

### Computation and selection Example 2.

Brine, density  $\rho$ : 1150 [kg/m<sup>3</sup>]  
 Brine flow  $G$ : 2,700 [kg/h]  
 Pressure drop  $\Delta p$ : 0.5 [bar]

In this example it is not possible to use the selection diagrams (fig. 5 - 8) as the refrigerant in question is not included.

Use the curves of the  $k_v$ -values instead (fig. 1 - 4) and calculate the required  $k_v$  by means of the formulas in the "Introduction" passage at the beginning of this chapter. Alternatively calculate the  $k_v$ -values by means of the calculation factor  $C_A$  (fig. 11) and the flow rate diagram (in this example: fig. 12) as per the following calculation example.

#### Calculation example:

Required  $k_v$ -value  
 $C_A = 0.00132$  (from fig. 18)  
 $k_v = C_A \times G$   
 $k_v = 0.00132 \times 2,700$  [kg/h]  
 $= 3.56$  [m<sup>3</sup>/h]

Fig. 11

Fig. 12

REG-SB 15 and REG-SB 20  
 with cone B can be used.

# Hand-operated regulating valves in stainless steel

## Types REG-SA SS and REG-SB SS

In certain specific areas such as outdoor applications and corrosive atmospheres, such as coastal installations, there is a need for high surface protection to prevent failure due to corrosion.

Today's food safety standards often call for daily treatment with detergents to protect against bacteria growth, again producing a need for high surface protection.

REG-SA SS and REG-SB SS are angle-way and straight-way hand-operated regulating valves, which act as normal stop valves in closed position.

The valves are designed to meet the strict quality requirements on refrigerating installations specified by the international classification societies and are carefully designed to present favourable flow conditions and accurate linear characteristics.

The valves are equipped with vented cap and have internal backseating enabling the spindle seal to be replaced with the valve still under pressure.

### Features

- Applicable to HCFC, HFC, R717 (Ammonia), R744 (CO<sub>2</sub>), Propane, Butane, Iso-Butane and Ethane.  
R717 Heat Pump and Propylene applications with replaced O-ring.
- Designed to give favourable flow conditions.
- Internal backseating enables replacement of the spindle seal whilst the valve is active, i.e. under pressure
- Housing is made of special cold resistant stainless steel approved for low temperature operations.
- Easy to disassemble for inspection and service.
- Butt-weld DIN and ANSI connections.
- Max. operating pressure: 52 bar g (754 psig)
- Temperature range: -60/+150°C (-76 +302°F).
- Compact and light valves for easy handling and installation.
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company.

### Pressure and temperature range

REG-SA SS/REG-SB SS DN15-DN40

## Hand-operated regulating valves in stainless steel, types REG-SA SS and REG-SB SS

### Design

#### Housing

Made of stainless steel approved for low temperature operations.

#### Connections

Available with the following connections:

- Butt-weld DIN (EN 10220)  
DN 15 - 40 (½ - 1½ in.)
- Butt-weld ANSI (B 36.19M)  
DN 15 - 40 (½ - 1½ in.)

#### The cone

The valves are available in two different versions – REG-SA SS with an A cone and REG-SB SS with a B cone. The A cone is designed for expansion lines, while the B cone is designed for regulating purposes e.g. liquid lines.

The valve cone is designed to ensure perfect regulation and provide an extensive regulating area. Irrespective of the refrigerant used, it is easy to obtain the correct capacity. A cone seal ring provides perfect sealing at a minimum closing momentum.

The valve cone can be turned on the spindle, thus there will be no friction between the cone and the seat when the valve is opened and closed.

Made of polished stainless steel, ideal for O-ring sealing. Furthermore, parts of the spindle are heat treated to obtain anti-abrasive/adhesive properties.

#### Packing gland - REG-SA SS and REG-SB SS

The stainless steel packing gland comprises a spring loaded seal packing gland which ensures a perfect tightness in the range: -60/+150°C (-76/+302°F).

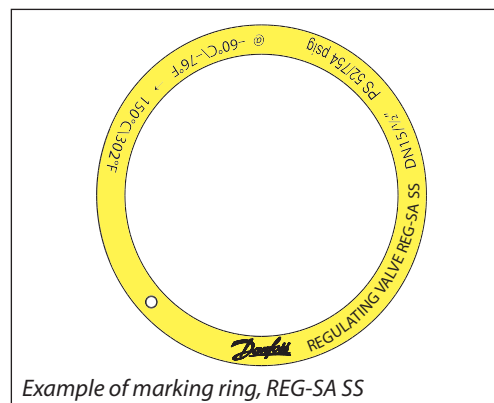

The packing glands are equipped with a scraper ring to prevent penetration of dirt and ice into the packing gland.

#### Installation

Install the valve with the spindle up or in horizontal position. The flow must be directed towards the cone.

The valve is designed to withstand high internal pressure. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion.

For further information refer to product instruction for REG-SA SS and REG-SB SS.

Example of marking ring, REG-SA SS

#### Pressure Equipment Directive (PED)

REG-SA/SB SS valves are approved according to the European standard specified in the Pressure Equipment Directive and are CE marked.

## Hand-operated regulating valves in stainless steel, types REG-SA SS and REG-SB SS

### Computation and selection

#### Introduction

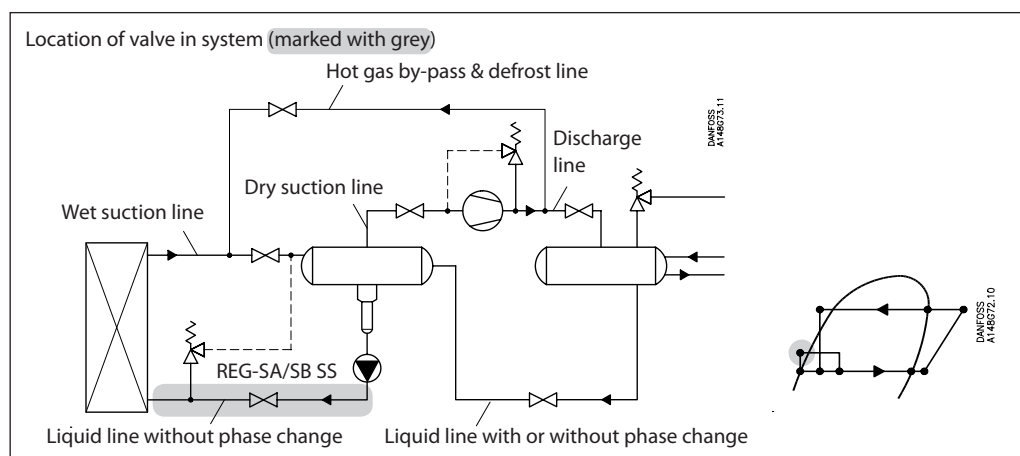

In refrigeration plants, regulating valves are primarily used in liquid lines in order to regulate the flow of refrigerant. The valves can, however, also be used as expansion valves. From a calculation point of view the two fields of application are very different.

Normal flow is the term used to describe the general case where the flow through the valve is proportional to the square root of the pressure drop across it and inversely proportional to the density of the refrigerant (Bernoullis equation).

This relationship between mass flow, pressure drop and density satisfies the majority of all valve applications with refrigerants and brines.

Normal flow is characterised by turbulent flow through the valve without any phase change. The following capacity curves are based on the above mentioned assumption.

Application of the regulating valves outside the normal flow area will reduce the capacity of the valve considerably. In such cases it is recommended to use "DIRcalc™" (Danfoss Industrial Refrigeration calculation programme).

#### Sizing regulating valve for liquid flow

Liquid refrigerants: Use the liquid tables, fig. 6 - 10. For other refrigerants and brines, "Normal flow" (Turbulent flow); see below and use the flow coefficient tables (fig. 1 - 2).

#### SI-units

Mass flow:

$$k_v = \frac{G}{\sqrt{\rho \times 1000 \times \Delta p}} = G \times C_A \text{ [m}^3/\text{h]}$$

Volume flow:

$$k_v = \frac{\dot{V}}{\sqrt{\frac{1000 \times \Delta p}{\rho}}} \text{ [m}^3/\text{h]}$$

#### Imperial units

Mass flow:

$$C_v = \frac{0.95 \times G}{\sqrt{\rho \times \Delta p}} = 31.6 \times G \times C_A \text{ [USgal/min.]}$$

Volume flow:

$$C_v = \frac{0.127 \times \dot{V}}{\sqrt{\frac{\Delta p}{\rho}}} \text{ [USgal/min.]}$$

$k_v$	[m <sup>3</sup> /h]	Quantity [m <sup>3</sup> /h] of water flowing through a valve at a pressure loss of 1 bar (according to VDE/VDI Norm 2173).	$C_v$	[US gal/min]	Quantity [US gal/min] of water flowing through a valve at a pressure loss of 1 psi.
$P_1$	[bar]	Pressure before the valve (upstream).	$P_1$	[psi]	Pressure before the valve (upstream).
$P_2$	[bar]	Pressure after the valve (downstream).	$P_2$	[psi]	Pressure after the valve (downstream).
$\Delta p$	[bar]	Actual pressure loss across the valve ( $P_1 - P_2$ ).	$\Delta p$	[psi]	Actual pressure loss across the valve ( $P_1 - P_2$ ).
$G$	[kg/h]	Mass flow through the valve.	$G$	[lb/min]	Mass flow through the valve.
$\dot{V}$	[m <sup>3</sup> /h]	Volume flow through the valve.	$\dot{V}$	[US gal/min]	Volume flow through the valve.
$\rho$	[kg/m <sup>3</sup> ]	Density of the refrigerant before the valve.	$\rho$	[lb/ft <sup>3</sup> ]	Density of the refrigerant before the valve.
$C_A$		Calculation factor (fig. 5).	$C_A$		Calculation factor (fig. 5).

Fig. 5

## Hand-operated regulating valves in stainless steel, types REG-SA SS and REG-SB SS

### Computation and selection

Example 1.

Refrigerant: R 717  
 Refrigerant flow: 2200 kg/h  
 Pressure drop:  $\Delta p = 0.5$  bar

The above mentioned example is illustrated on the following flow rate diagram and shows that REG-SB SS 15 and 20 with cone B can be used. The main rule is that nominal regulation range should be below 85% opening degree. If the arrowline is crossing 2 cone curves, the smaller cone should be selected if opening degree < 85%.

The example is only correct if the density of the refrigerant is approx. 670 (kg/m<sup>3</sup>), and there must be no build-up of flash gas in the valve.

Flow rate diagram

Fig. 6

## Hand-operated regulating valves in stainless steel, types REG-SA SS and REG-SB SS

### Computation and selection

Example 2.

Brine, density  $\rho$ : 1150 [kg/m<sup>3</sup>]  
 Brine flow  $G$ : 2,700 [kg/h]  
 Pressure drop  $\Delta p$ : 0.5 [bar]

In this example it is not possible to use the selection diagrams (fig. 3 and 4) as the refrigerant in question is not included.

Use the curves of the  $k_v$ -values instead (fig. 1 - 2) and calculate the required  $k_v$ , by means of the formulas in the "Introduction" passage at the beginning of this chapter. Alternatively calculate the  $k_v$ -values by means of the calculation factor  $C_A$  (fig. 7) and the flow rate diagram (in this example: fig. 8) as per the following calculation example.

Calculation example:

Required  $k_v$ -value  
 $C_A = 0.00132$  (from fig. 18)  
 $k_v = C_A \times G$   
 $k_v = 0.00132 \times 2,700$  [kg/h]  
 $= 3.56$  [m<sup>3</sup>/h]

## Hand-operated regulating valves in stainless steel, types REG-SA SS and REG-SB SS

### Ordering

#### How to order

The table below is used to identify the valve required.

Please note that the type codes only serve to identify the valves, some of which may not form part of the standard product range. For further information please contact your local Danfoss Sales Company.

#### Type codes

Valve type	REG SA SS REG-SB SS	Regulating Valves

## Gauge valves

### Type SNV-ST and SNV-SS

SNV-ST and SNV-SS valves are designed to meet all industrial refrigeration application requirements. Designed as service valves they provide favourable flow characteristics.

#### Features

- Applicable to HCFC, non flammable HFC, R717 (Ammonia) and R744 (CO<sub>2</sub>).
- Suitable for "heavy duty" industrial applications having a very sturdy and safe design including high pressures and wide temperature range.
- The SNV-ST and SNV-SS valves have backseating (metal to metal).
- Compact and light valve for easy handling and installation
- No special flow direction required.
- Provide high flow characteristics.
- Each valve type is clearly marked with type and size.
- Housing and bonnet material is low temperature steel (stainless steel for SNV-SS) according to requirements of the Pressure Equipment Directive and other international classification authorities.
- Valve safety is enhanced with the spindle being secured such that it cannot be unscrewed.
- Max. operating pressure:  
52 bar g / 754 psig  
Valves for higher operating pressure available on request
- Full temperature range:  
-60 – 150 °C / -76 – 302 °F
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company.

## Gauge valves, type SNV-ST and SNV-SS

### Technical data

- **Refrigerants**  
Applicable to HCFC, non flammable HFC, R717 (Ammonia) and R744 (CO<sub>2</sub>). For further information please see installation instruction for SNV-ST.
  - **Temperature range**  
-60 – 150 °C / -76 – 302 °F.
  - **Maximum working pressure**  
The valve is designed for: Maximum operating pressure of 52 bar g / 754 psig. Valves for higher operating pressure available on request.
- For further information please contact your local Danfoss Sales Company.

### Design

#### Connections

Available with the following connections:

- CD Cutting ring
- MPT Male NPT (ANSI/ASME B1.20.1)
- FPT Female NPT (ANSI/ASME B1.20.1)
- R Male (ISO 7-1)
- RC Female (ISO 7-1)
- G
- W Welding connection

#### Housing

Made of special steel, approved for low temperature operations.

#### Spindle

Equipped with stainless steel spindle, which is ideal for O-ring sealing.

#### Installation

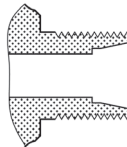

No special flow direction is required. The valve is designed to withstand high internal pressures. However, the piping system in general should be designed to avoid liquid traps and reduce the risk of hydraulic pressure caused by thermal expansion. For further information refer to installation instruction for SNV-ST and SNV-SS.

# Shut-off valve Type QDV

QDV is a shut-off valve, designed particularly for draining oil from systems containing refrigerant (ammonia) under pressure.

The valve will close immediately on release of the handle, thus protecting user and environment against unnecessary refrigerant leaks. The valve should as a rule be installed as illustrated in fig. 1.

In order to prevent hydraulic pressure building up between the stop valve and the QDV an integral relief device is included as part of the cone arrangement, which will open at approx. 16 bar / 232 psig.

QDV is designed to meet the safety demands specified by national and international authorities within industrial refrigeration.

## Features

- Applicable to R717 (ammonia).
- Meets the safety demands within industrial refrigeration
- Handle can be positioned 360°
- Built-in integral relief device opening over 16 bar g (preventing hydraulic pressure building up between shut-off valve and QDV)
- Can be supplied together with a stop valve for quick on site mounting (fig. 1)
- Max. operating pressure: 40 bar g / 580 psi g
- Temperature range: -50 – 150 °C / -58 – 302 °F
- Classification: DNV, CRN, BV, EAC etc.  
To get an updated list of certification on the products please contact your local Danfoss Sales Company

## Shut-off valve, type QDV 15

---

### Design

#### Connections

Available with the following connections:

- Inlet: Welding DIN (EN 10220)
  - ½ in FPT
  - ¾ in FPT
- Outlet: G ¾ in pipe thread (ISO 228/1)
  - ½ in FPT
  - ¾ in FPT

Optional extras for outlet:

- Welding nipple DIN (EN 10220)
- Hose connection

Other types of connection are available on request.

#### QDV - SVA combinations

Combinations of the QDV together with a dedicated SVA have been established for easy selection. Please study page 101 to find the code numbers for these combinations.

#### Installation

For further information refer to installation instruction for QDV.

---

### Technical data

- Refrigerants  
Applicable to R717 (ammonia).
- QDV is a backpressure dependent valve. If any tube or hose is mounted on the outlet of the QDV it has to be calculated to prevent backpressure building up when relieving.
- For further information please see installation instruction for QDV.  
Flammable hydrocarbons are not recommended, for further information please contact your local Danfoss Sales Company.
- Temperature range  
-50 – 150 °C / -58 – 302 °F.
- Pressure  
The valve is designed for:  
Maximum operating pressure of 40 bar g / 580 psi g

Hose connection for outlet

No.	Part	Material
12a	O-rings	Cloroprene (Neoprene)
12c	Stub for hose - OD Ø15 mm	Steel
12d	Union nut - G ¾"	Steel

Welding nipple connection for outlet

No.	Part	Material
13a	Al-packing	Aluminium
13b	Welding nipple - OD Ø21.3 mm	Steel (S235JR)
13c	Union nut - G ¾"	Steel

## Shut-off valve, type QDV 15

### Connections

		$\varnothing D_1$	$\varnothing D_3$	$\varnothing D_4$	$\varnothing D_5$

## Shut-off valve, type QDV 15

### Dimensions

Valve size		A	C <sub>max</sub>	E
QDV 15	[mm]	45	185	109
	[in]	1.77	7.28	4.29

### Ordering

#### How to order

The table below is used to identify the valve required.

Type	Inlet	Outlet	Code no.
QDV 15 DN 15	DN 15	G ¾ in	<b>148H3272</b>
QDV 15 ½ in FPT	½ in FPT	½ in FPT	<b>148H3273</b>
QDV 15 ¾ in FPT	¾ in FPT	¾ in FPT	<b>148H3274</b>
QDV 15 DN 15 + SVA-ST DN 15 H-WHEEL*	DN 15	G ¾ in	<b>148H3310</b>
QDV 15 ½ in FPT + SVA-ST SOC ½ in H-WHEEL*	½ in SOC	½ in FPT	<b>148H3311</b>
Fittings for hose connection - G ¾"			<b>148H3451</b>
Fittings for welding connection - G ¾"			<b>148H3452</b>

\* Two valves are supplied in one box and should be mounted on site.  
The indicated inlet is for the stop valve - The indicated outlet is for the oil drain valve.

#### Important!

Where products need to be certified according to specific certification societies or where higher pressures are required, the relevant information should be included at the time of order.
