

Data sheet

Liquid level regulating valves

Types PMFL / PMFH and SV

For modulating liquid level control in refrigeration, freezing and air conditioning plant, a system comprising a liquid level regulating valve type PMFL or PMFH, controlled by a pilot float valve type SV, is used.

PMFL and SV systems are used on the evaporator side. PMFH and SV systems are used on the condenser side.

The system is suitable for use with ammonia or fluorinated refrigerants. The PMFL and PMFH can be used in liquid lines to or from

- evaporators
- separators
- intermediate coolers
- condensers
- receivers

Modulating liquid level regulation provides liquid injection that is proportional to the actual capacity. This gives a constant amount of flashgas, thus ensuring stable regulation and economic operation because variations in pressure and temperature are held to a minimum.

Features

- Applicable to HCFC, HFC and R717 (Ammonia).
- PMFL / PMFH are based on PM valve family housings.
- Same flange programme as for PM valve series.
- Valve housing in low temperature cast iron (spherical) - EN GJS 400-18-LT.
- Manual operation possible.
- Position indicator available.
- Pressure gauge connection to monitor inlet pressure.
- Simple installation.
- Main valve top cover can be located in any position without affecting the function.
- Classification: DNV, CRN, BV, EAC etc. To get an updated list of certification on the products please contact your local Danfoss Sales Company.

Approvals

Pressure Equipment Directive (PED)
The PMFL / PMFH valves are approved and CE marked in accordance with Pressure Equipment

Directive - 97/23/EC.
For further details / restrictions - see Installation Instruction.

PMFL / PMFH-valves*			
Nominal bore	DN ≤ 25 (1 in.)	DN 32-125 mm (1 ¼ - 5 in.)	DN 150 mm (6 in.)
Classified for	Fluid group I		
Catagory	Article 3, paragraph 3	II	III

* CE is only applicable to the EN GJS 400-18-LT

Technical data

Refrigerants

Applicable to HCFC, HFC and R717 (Ammonia).

Max. working pressure

PMFL / H: MWP = 28 bar

SV: MWP = 28 bar

Max. test pressure

PMFL / H: Max. test pressure = 42 bar

SV: Max. test pressure = 42 bar

Temperature of media:

-60 – 120 °C.

Note:

Max. working pressure is limited to MWP = 21 bar when media temperatures are: below -20 °C for valves made of GGG-40.3 and below -10 °C for valves made of GG-25.

Design / Function

PMFL

- 6. Seal plug
- 10. Valve spindle
- 12. Valve seat
- 19. Valve body
- 19a. Channel in valve body
- 20. Bottom cover
- 23. Main spring
- 24. Servo piston
- 24a. Channel in servo piston
- 30. Top cover

- 43. Supplementary spring
- 44. Manometer connection
- 53. Spindle cap
- 60. Setting spindle
- 73. Pilot connection

When the liquid level inside the float drops, the float orifice opens. This relieves the higher pressure, p_s , acting on the servo piston to the low pressure side causing the PMFL to open. Variations in liquid level will result in variations

in pressure over the piston and variation in the amount of liquid injected. It is important to choose the correct spring set when designing the plant. The spring set should be selected from the table below:

Subcooling		Pressure difference over main valve			
		bar	psi	bar	psi
K	F	4 – 15	58 – 218	1.2 – 4.0	17 – 58
0 – 8	0 – 14	Normal spring set		Weak spring set	
8 – 40	14 – 72	Strong spring set			

The setting spindle, pos. 60, has not been set from factory. It is imperative that the setting spindle is adjusted before the valve is put into operation. The outer spring, pos. 23, is preset and the inner spring, pos. 43, is adjusted when

turning the spindle. The following tables shows the adjustment of the inner spring in number of turns of the spindle as a function of valve size, spring type and pressure difference:

PMFL	C/w normal (factory mounted) spring set, subcooling 0 – 8 K ~ 0 – 14 F				
	Pressure difference (Δp) over PMFL in bar or psi				
	< 5 bar < 72 psi	5 – 8 bar 72 – 116 psi	8 – 10 bar 116 – 145 psi	10 – 12 bar 145 – 174 psi	> 12 bar > 174 psi
80	No tension	2 – 3	3 – 4.5	4.5 – 6	ca. 7
125	No tension	3 – 5	5 – 7	7 – 9	ca. 10
200	No tension	3 – 5	5 – 7	7 – 9	ca. 10
300	No tension	4 – 6	6 – 9	9 – 12	ca. 14

PMFL	C/w strong spring set, subcooling 8 – 40 K ~ 14 – 72 F	
	Pressure difference (Δp) over PMFL in bar or psi	
	6 – 9 bar 87 – 131 psi	> 9 bar > 131 psi
80	4	Max. tension
125	6	Max. tension

PMFL	C/w strong spring set, subcooling 8 – 40 K ~ 14 – 72 F	
	Pressure difference (Δp) over PMFL in bar or psi	
	6 – 16 bar 87 – 232 psi	
300	Spring must always be set to max. tension	

PMFL	C/w weak spring set, low pressure plants			
	Pressure difference (Δp) over PMFL in bar or psi			
	1.2 – 1.8 bar 17 – 26 psi	1.8 – 2.5 bar 26 – 36 psi	2.5 – 3 bar 36 – 43 psi	3 – 4 bar 43 – 58 psi
80	No tension	3 – 4	4 – 6	Max. tension
125	No tension	4 – 6	6 – 8	Max. tension
200	No tension	4 – 6	6 – 8	Max. tension
300	No tension	5 – 7	5 – 7	Max. tension

Design / Function
(continued)

The values for spindle turns are an indication for an initial setting only. If a position indicator is used, a more precise modulation can be achieved when fine tuning the valve setting. If the PMFL is not opening fully, the spring tension must be reduced. If the PMFL is operating in a ON / OFF function, the spring tension should be increased. The condenser pressure will have an effect on the fine tuning and large variations in condensing pressure might call for readjustment. The subcooling is measured just before the PMFL and the pressure difference is for the valve only excluding piping and armatures.

The PMFL can be used together with SV 4 as a pilot valve.

PMFL function example

The orifices determines the K_v (C_v) value of the pilot and the following table can be used as an initial selection guide:

PMFL	SV 4 - 6	
	Ø 2.5	Ø 3 (SV 4)
80	X	
125	X	
200	X	
300		X

The final choice of orifice may vary depending on refrigerant and pressure levels. Smaller pressure levels needs a bigger orifice. Pressure difference levels below 3 bar (43 psi) need SV 4 - 6 with Ø3 mm orifice.

SV floats for PMFL

SV 4 can be used for PMFL low pressure control system. The float must be connected as shown.

Note: Only one inlet connection possible for SV 4.

PMFH

- 3. Manometer connection
- 6. Seal plug
- 10. Valve spindle
- 19. Valve body
- 19a. Channel in valve body
- 20. Bottom cover
- 21a. Channel in servo piston
- 23. Main spring
- 24. Servo piston
- 30. Top cover
- 30a.b.c. Channels in top cover
- 31. Valve cone
- 53. Spindle cap
- 60. Manual opening
- 73. Pilot connection

If the liquid level inside the SV float rises, the float orifice opens and relieves pressure through the pilot line to the top of the PMFH, increasing the pressure, p_s , moving the pushrod downwards and opening the PMFH. The pilot line is connected in the topcover at SI. Override of the pilot signal can be made by using an EVM valve at SII. It is important to choose the correct spring set when designing the plant. The spring set should be selected from the table below:

The PMFH can be used together with either SV 1 or 3 with the SV mounted with the bleed valve downwards, refer to the drawing below. This reverses the opening so that rising float opens the orifice.

Pressure difference over main valve			
bar	psi	bar	psi
0 – 4.5	0 – 65	> 4.5	> 65
Weak spring set		Normal spring set	

PMFH function example

Design / Function
(Continued)

SV 1 – 3

SV 1 – 3 float has 2 different pilot connections: S-port (series connection with PMFH) or P-port (parallel connection with the PMFH).

a preset point. Shut off can be done via an electrical switch if an EVM valve is mounted in the SII port in the top of the PMFH. It is only advisable to use the P-port at low pressure difference.

P-port:

When using the P-port, it is possible to force open the PMFH valve to a fully open position. This is practical for service purposes or to confirm if the float has sufficient capacity for the PMFH and the operating conditions. However, when P-port connection is used it is possible to overfill a system due to constant bleeding or unauthorised tampering. In this case, it is advisable to introduce a shut off when the liquid level reaches

S-port:

The S-port offers the advantage of a preorifice which divides the pressure drop and any wear possibility due to cavitation. S-port connection must be used at high pressure differences, $dp > 10$ bar (145 psi). The K_v (C_v) value of the SV is higher using P-port than using S-port. A higher P-band can thus be obtained.

Sizing

Sizing example for PMFL

Refrigerant
R 717 (NH₃)

Evaporator capacity
 $Q_e = 600$ kW

Evaporating temperature
 $t_e = -10$ °C ($\sim p_e = 2.9$ bar abs.)

Condensing temperature
 $t_c = 30$ °C ($\sim p_c = 11.9$ bar abs.)

Liquid temperature ahead of valve
 $t_l = 20$ °C at max. capacity

Subcooling
 $\Delta t_{sub} = t_c - t_l = 30 - 20$ °C = 10 K
Calculations do not take into account pressure loss in pipelines.

Pressure drop across valve
 $\Delta p = p_c - p_e = 11.9 - 2.9$ bar = 9 bar

Correction factor for 10 K subcooling
0.98

Corrected capacity
 600 kW \times 0.98 = 588 kW

The corrected capacity can be found in the capacity table. It will be seen from the table that valve type PMFL 80-4 should be chosen. Referring to "ordering table", code number **027F0053** can be found.

For details of flanges, accessories and pilot valve, see the ordering table.

Since $\Delta p = 9$ bar and $\Delta t_{sub} = 10$ K, it will be seen from the "C/w strong spring set" for PMFL that a "STRONG" spring set must be used. The pilot line is connected to SV at connection S. In the ordering table the code number for the spring set can be found: **027F0118**.

Sizing example for PMFH

Refrigerant
R 717 (NH₃)

Evaporator capacity
 $Q_e = 2200$ kW

Evaporating temperature
 $t_e = -10$ °C ($\sim p_e = 2.9$ bar abs.)

Condensing temperature
 $t_c = 30$ °C (~ 11.9 bar abs.)

Liquid temperature ahead of valve
 $t_l = 20$ °C

Subcooling
 $\Delta t_{sub} = t_c - t_l = 30 - 20$ °C = 10 K
Calculations do not take into account pressure loss in pipelines.

Pressure drop across valve
 $\Delta p = p_c - p_e = 11.9 - 2.9$ bar = 9 bar

Correction factor for 10 K subcooling
0.98

Corrected capacity
 2200 kW \times 0.98 = 2156 kW

The corrected capacity can be found in the capacity table. It will be seen from the table that valve type PMFH 80-7 should be chosen. In the ordering table the code number for the valve can be found: **027F3060** for CE-approved valve.

For details of flanges, accessories and pilot valve, see the ordering table.

Correction factors

When dimensioning, multiply the evaporator capacity by a correction factor k dependent on

the subcooling Δt_{sub} just ahead of the valve. The corrected capacity can then be found in the capacity table.

¹⁾ Code no. applies to one flange set consisting of one inlet and one outlet flange.

²⁾ Dimension sketch see spare part catalogue.

Stainless steel: flanges, bolts for flanges and top and bottom covers, see spare parts catalogue.

Pilot valves SV 1 – 3

Type	Connection		Code no.	
Float pilot valve type SV	Balance tube liquid / vapour	Pilot line	SV 1: 027B2021 027B2021CE ²⁾	SV 3: 027B2023 027B2023CE ²⁾
	1 in. weld	Ø 6.5 / Ø 10 mm weld ¹⁾		

¹⁾ 3/8 in. flare connection can be supplied under code no. **027B2033**.

²⁾ Approved and CE-marked in accordance with Pressure Equipment Directive - 97/23/EC.

Pilot valves SV 4

Valve type	Orifice diameter	Code no.	Code no. without housing ¹⁾
SV 4	Ø 3.0 mm	027B2024 ²⁾	027B2014 ²⁾

¹⁾ Flange for mounting without housing Code no. 027B2027.

²⁾ Approved and CE-marked in accordance with Pressure Equipment Directive - 97/23/EC.

The code nos. stated apply to liquid level regulators type SV 4, 5 and 6 with two 1" weld connections for balance tubes and two 1/2" weld joints for liquid and evaporator connections respectively.

Spare parts and accessories

Smaller orifices for the SV 4 are available as spare parts.

 – Seal kit: **027B2070**
Special orifice code no. for SV 4

Orifice diameter	K _v	Code no. ¹⁾
Ø 1.0 mm	0.026	027B2080
